

“Smart IV Monitoring System”

Preventing Complications

Empowering Healthcare

The Problem of Manual IV Monitoring

In hospitals, nurses have to manually check IV fluid levels. This can lead to human errors, delays in response, and serious risks like backflow or air entering the patient's vein. Manual monitoring also takes up valuable staff time that could be used for other critical care tasks.

A Smart IV Monitoring System as a Solution

Our system automatically tracks the IV bag's weight and it alerts nurses when the fluid is low, so they don't have to check it manually. The system also shows the weight on a display and through a Wi-Fi connection, allowing remote monitoring.

KEY FEATURES

- Shows IV fluid level in real time
- Sends alerts when fluid is running low
- Can be checked from a phone or computer
- Shows weight on a small screen
- Helps avoid mistakes by nurses
- Saves time – no need to check bags often
- Low cost and easy to use in many hospitals
- Alert level can be set for each patient

This low-cost system can be used in hospitals, clinics, and elder care homes to improve safety and save time, making it ideal for large-scale use in the growing smart healthcare market.

Empowering healthcare with _____
_____ smart, real-time IV monitoring—because every drop counts.
